PROFILE

Full-Stack Developer with 2+ years of experience building web applications with .NET (C#) and Angular through personal and freelance projects.

Currently working in back-office operations for Italian insurance providers, where I use code to automate repetitive workflows.

Based in Oradea, open to relocation, hybrid or remote roles.

TECHNICAL SKILLS

Languages: C#, TypeScript, JavaScript, SQL, PowerShell

Frameworks: ASP.NET Core, Entity Framework, Angular (v12+)

Databases: SQL Server, MongoDB

Web Technologies: REST APIs, HTML5, CSS, Bootstrap

Backend Concepts: Clean Architecture, Repository Pattern, DTOs, JWT Authentication, RBAC, async/await

DevOps & Tools: Git, Docker, Swagger, Postman

OS & Infrastructure: Virtual Machines (VMware, VirtualBox, UTM), Windows, Linux, macOS

AI & LLM: Ollama, local LLM integration (gemma2)

PROFESSIONAL EXPERIENCE

FinProm | Financial & Commercial Intermediary (Insurance Back-Office Operations)
2021 – Present

- Process and manage client case files for 6 Italian insurance providers (AXA, Cardif, K5, Net Insurance, Sogecap SA, Vittoria) on Q-Task, the company's multi-bank cloud platform: installment payment notifications, payment requests, and data entry from scanned documents into Excel records.
- Identified repetitive, time-consuming manual workflows within the team and proactively built automation tools to eliminate them, saving 25+ hours of manual work per month in total.

- Developed a browser-based text generator (HTML/JavaScript) that parses clients' Excel amortization plans and automatically produces standardized Italian installment texts, reducing processing time from 5–7 to 1–2 minutes per case file across 10–15 files daily (~4–5 hours saved per week).
- Wrote a PowerShell script that automatically sorts 250–300 PDF documents per batch into per-client folders by surname matching, cutting each twice-monthly batch from 4–5 hours (often requiring two people) to under 20 minutes (~90% time reduction).
- Designed the script with safety in mind: a dry-run mode (-WhatIf) to preview changes, detection of ambiguous matches flagged for manual review, and a rollback script to restore the original state.

PERSONAL PROJECTS

Somo | Full-Stack Developer (.NET, Angular, MongoDB) 2025 – Present *(In Development)*

- Built a veterinary clinic finder platform — Angular SPA + ASP.NET Core + MongoDB — enabling pet owners to locate nearby clinics via Google Maps geolocation and book appointments through a 6-step guided flow.
- Implemented Clean Architecture with strict separation across 4 layers (Domain, Application, Infrastructure, API), keeping business logic fully isolated from infrastructure concerns.
- Applied Generic Repository Pattern and dedicated DTOs for Vets, Clinics, Pets, and Appointments — decoupling the internal domain model from the API contract.
- Secured the platform with JWT-based authentication and role-based authorization (Owner / Vet / ClinicAdmin) controlling access across all endpoints.
- Integrated MongoDB via a custom MongoRepository for flexible storage of complex medical documents.

Device Management System | Full-Stack Developer (.NET, Angular, MongoDB) 2026

- Built a device inventory management platform — Angular SPA + ASP.NET Core + MongoDB — with full CRUD, JWT authentication, role-based access control, and device assignment per user.
- Integrated an AI-powered description generator using Ollama (gemma2:2b) to automatically generate human-readable device descriptions from technical specifications.
- Implemented a free-text search engine with relevance ranking, scoring matches across Name, Manufacturer, Processor, and RAM fields without external search libraries.

MeigoWeb | Full-Stack Developer (.NET, Angular, SQL Server) 2024 – 2025

- Built a full-stack e-commerce platform for clothing retail — Angular + ASP.NET Core + SQL Server — supporting product browsing, cart management, and order placement across mobile, tablet, and desktop.
- Designed and implemented the relational SQL Server schema (products, users, carts, orders) with Entity Framework Core, using async/await throughout the data access layer.

- Implemented role-based access control (Customer / Admin) using IdentityServer 8 and JWT tokens, with hashed passwords and fully separated route guards preventing unauthorized access to the admin panel.
 - Developed a comprehensive admin dashboard covering inventory management (add, edit, delete products), order history tracking, and a monthly sales chart with calendar-based reporting.
-

Wing Tsun Connect | Frontend Developer (Angular) 2026

- Developed a responsive showcase website for a martial arts academy — Angular SPA deployed to production via Netlify with GitHub-integrated CI/CD for automatic updates on every commit.
- Built modular, reusable Angular components ensuring a consistent visual identity and a fluid single-page experience across all devices

EDUCATION

Bachelor's Degree in Automation and Applied Informatics | 2020 – 2024

University of Oradea, Faculty of Electrical Engineering and Information Technology

LANGUAGES

Romanian: Native

English: B2

Italian: Professional insurance terminology (reading)
